ALFA-DRY

Drying times 35% quicker!

The Alfa-Dry system has been developed in co-operation with well known paint companies. The result is a good performance drying system for quick drying of waterbased paints and 2K-paints.

- Very fast drying of waterborne paints, especially in combination with increased temperature.
- Drying times 35% quicker.
- Increased number of paint jobs per day.
- Energy savings.

In quiet weather conditions laundry will dry slowly. With a small wind laundry will dry quickly with the turbulent air flow.

STANDARD

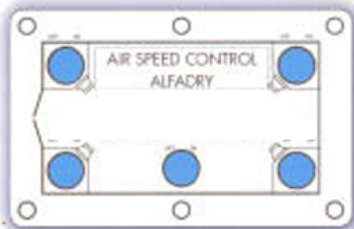

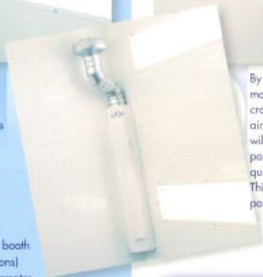

The same happens in a spraybooth, where during the drying cycle the air flows around the car in a equal flow to the extraction pit. The air hardly touches the car, (ideal in spraying mode).

- Easy install in new and older booths of any brand or type
- No use of compressed air
- Air is been drawn from inside of the booth (already filtered at less than 10 microns)
- The design of the adjustable air jets creates an optimised airflow
- Very user-friendly control panel. Each unit can be switched on and off individually
- Nice dust free design
- Maintenance friendly
- Available in standard version and full approved ATEX-version (both versions have standard protective doors)

ATEX

By making the air turbulent in drying mode, because of the interaction with cross-flow from the Alfa-Dry system, the air will hit more of the bodywork which will result in a quicker warming up of the panels and the evaporation will be much quicker. This will result in a faster drying of the point.
